Кафедра интеллектуальных информационных технологий

Отчет по лабораторной работе №3

Специальность ПО5

Выполнил: А.А. Игнатюк, студент группы ПО-5
Проверил: А.А. Крощенко, ст. преп. кафедры ИИТ,
«» 2021 г.

Цель работы: Научиться создавать и использовать классы в программах на языке программирования Java.

Вариант 5.

Задание 1.

Реализовать простой класс.

Требования к выполнению:

- Реализовать пользовательский класс по варианту.
- Создать другой класс с методом main, в котором будут находится примеры использования пользовательского класса.

Для каждого класса:

- Создать поля классов.
- Создать методы классов.
- Добавьте необходимые get и set методы (по необходимости).
- Укажите соответствующие модификаторы видимости.
- Добавьте конструкторы.
- Переопределить методы toString() и equals().
- 5) Множество целых чисел ограниченной мощности. Предусмотреть возможность объединения двух множеств, вывода на печать элементов множества, а также метод, определяющий, принадлежит ли указанное значение множеству. Класс должен содержать методы, позволяющие добавлять и удалять элемент в/из множества. Конструктор должен позволить создавать объекты с начальной инициализацией. Мощность множества задается при создании объекта. Реализацию множества осуществить на базе одномерного массива. Реализовать метод equals, выполняющий сравнение объектов данного типа.

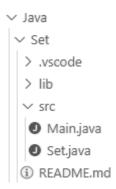

Спецификация ввода:

java Main

Спецификация вывода:

<параметры функций System.out.println() (содержимое коллекций, результаты сравнений)>

 34
```

Результаты тестирования:

```
5, 6, 7
5, 6
2, 3, 6, 7, 9
1, 3, 4, 7, 8
set_2 is not equal to set_3
1, 2, 3, 4, 5, 6, 7, 8, 9
```

Задание 2.

Разработать автоматизированную систему на основе некоторой структуры данных, манипулирующей объектами пользовательского класса. Реализовать требуемые функции обработки данных.

Требования к выполнению:

- Задание посвящено написанию классов, решающих определенную задачу автоматизации.
- Данные для программы загружаются из файла (формат произволен). Файл создать и написать вручную.

5) Моделирование файловой системы.

Составить программу, которая моделирует заполнение гибкого диска (1440 Кб). В процессе работы файлы могут записываться на диск и удаляться с него.

С каждым файлом (File) ассоциированы следующие данные:

- Размер.
- Расширение.
- Имя файла.
- Как файлы могут трактоваться и директории, которые в свою очередь содержат другие файлы и папки.

Если при удалении образовался свободный участок, то вновь записываемый файл помещается на этом свободном участке, либо, если он не помещается на этом участке, то его следует разместить после последнего записанного файла. Если файл превосходит длину самого большого участка, выдается аварийное сообщение. Рекомендуется создать список свободных участков и список занятых участков памяти на диске.
